"The Influence of Adrenal Hormones, Starvation and Alloxan Diabetes on Non-esterified Fatty Acids in the Plasma of Rat Fetus and Newborn Rats."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 2, Feb 66, pp 81-82

Abstract: Concentration of non-esterified fatty acids (NEFA) in the serum of fetus is 1/3 less than in adult rats; the increase in NEFA which normally takes place after birth can be reduced by administration of dihydroergotamine. Epinephrine and prednisone cause an increase in NEFA in animals 1 day old only when they are starved; in animals over 10 days old, the increase occurs always. Alloxan diabetes increases the NEFA content in the serum of both mother and fetus. No references. Submitted at "16 Days of Physiology" at Kosice, 28 Sep 65.

New possibilities for the application of activated aluminum. A. Komwaller and A. Hauer (Bopron, Hung.). *Acta Tech. Acad. Sci. Hung.* 2, No. 1: 43-58 (1961). Active Al is Al amalgam. Its reaction rate with liquid Hg varies irregularly, owing to the desquamation of a scablike layer, causing Hg losses, and resulting first in an increase, then in a decrease, of activity until finally Hg-free Al remains. Al activated by Hg cementation releases in an excess of H<sub>2</sub>O at a temp. of 15° approx. 0.12 cc. H<sub>2</sub> gas per sq. cm. surface, until it loses its activity after a total release of 90 cc. gas per sq. cm. surface. This rate and total amt. depend also on the treatment of the Al during activation and upon stresses in the original surface. Activation, e.g. in an ethereal HgCl<sub>2</sub> soln., is approx. 3 times as effective as activation in aq. HgCl<sub>2</sub>. Activated Al is suitable for the

deviation of gases, org. liquids, and for the careful dehydration of adsorbing gels (SiO<sub>2</sub> or Al<sub>2</sub>O<sub>3</sub>) A. M. P.

Prague, Vojenske Zdravotnicke Listy, Vol 35, No 6, Dec 66, pp 246 - 252

Abstract [Authors' English summary modified]: 115 rheumatic patients who were treated with steroid therapy, combined with sodium salicylate and or sodium gentisate were examined; the incidence of valvular defects was much more frequent than in a group of 94 rheumatic soldiers who did not receive the steroids. On the other hand, the incidence of valvular defects due to rheumatic inflammation of endocardial valves was lower in the first group. The authors recommend the administration of cortisonoids in indicated cases of rheumatic carditis. 12 Tables, 57 references (not specified).

In a woman of 45 yr. with rheumatic mitral disease who had a normal ECG up to that time, a paroxysm of tachycardia set in accompanied by retrosternal pains and later on by symptoms of heart failure. It was a case of impure atrial flutter with aberrant ventricular complexes. The ventricle rate in some ECG tracings was 300 per min., in others 150. In the phase of rapid frequency of the ventricles a ventricular tachycardia could not be excluded. Single ventricular complexes were normal, whereas most of them were prolonged and resembled those in W-P-W syndrome. As soon as the sinus rhythm was re-established through quinidine treatment, a W-P-W syndrome appeared, the ventricle complexes of which strikingly resembled those recorded in paroxysm of tachycardia. The necessity of respecting the diagnostic criteria in ventricular tachycardia was pointed out in the discussion. In this respect a critical standpoint was taken towards many cases that have been described in the literature as ventricular tachycardia. The probably acquired cause of this case described of W-P-W syndrome was dealt with. The origin and clinical symptoms were very similar to those provoked experimentally by Prinzmetal who by stimulation of atrio-ventricular node induced patterns of W-P-W syndrome and accompanying arrhythmias. (XVIII, 6\*)

„Charakterystyka mikrobiologiczna gleb Białowieżskiego Parku Narodowego”. Roczniki Nauk Leśnych. Tom 1. 1953, PWRIL, pp. 43—70, 6 tabs.

With a view to determining the connection existing between the forest phytocenosis type and the quantitative and qualitative composition and dynamics of the soil microflora, investigations were carried out over 8 biotopes from the Białowieża National Park. The percentage composition of soil microflora for each biotope is given, as also the quantitative changes taking place during the three warmer seasons, the correlation between these changes and the soil moisture content and acidity. The importance of these studies for forestry as well as for medicine and the pharmaceutical industry is emphasized.

Process for facilitating techniques of paper chromatography. L. Chiosa and Ana Haulică. *Acad. rep. populare Romîne, Inst. fiziol. normale patol. Dr. Danielopolu, Studii cercetări fiziol.* 3, 535-7(1959).—The process, by which the soln. and the substance to be tested can be deposited simultaneously without prejudicing the accuracy of the measurement, consists in cutting longitudinal, parallel, narrow strips into the paper, 0.4-0.8 × 4-5 cm. These rectangular strips remain attached to the paper. By means of 2 thin rods these strips are lifted above the level of the rest of the paper, and the total quantity of the liquid (0.02-0.03 ml.) is left to run into the center of the strips. They are dried, the rods are pulled out, and the strips are placed in the chromatographic vessel, where they are processed in the usual manner. Felicitas D. Goodman

Title : The Inhibitory Action of Sodium Salicylate, Pyramidon, Aspirin and Antipyrine on the Spleen Introceptors.

Orig Pub : Acad, R.P.R. 1954 Bucuresti, 1955, 49-62

Abstract : The reflex changes in the mechanics of the iliac loop, respiration and blood pressure at a perfusion of the spleen with solutions of sodium salicylate, pyramidon, aspirin and antipyrine when stimulated by a solution of KCL, was studied. Aspirin at first somewhat strengthened, then weakened the reflexes, induced by KCL. Pyramidon and antipyrine caused a rapidly developing brief depression; sodium salicylate - a slow prolonged depression. It is believed that the mechanics of the therapeutic action of the drugs under study is determined largely by their depressing action on the introreception.

It has been found that ChE suppresses the compensatory parasympathetic effect of small doses of adrenaline on guinea-pig terminal ileum and frog rectus abdominis, while small doses of adrenaline inactivate ChE. It is concluded that the parasympathetic effect of small doses of adrenaline is due to inhibition of ChE, perhaps owing to the anti-alkaline effect of such doses. By the same mechanism large doses of adrenaline produce a stronger effect in presence of ChE.

Abstract : Perfusion of the spleen with simultaneous recording of blood pressure, respiration and movements of the iliac colon was performed upon anesthetized dogs. The addition of 0.1 gm KCl to the perfusate produced a depression of intestinal movements and of vascular and respiratory reflexes. The addition of KCl in the stated dose after 0.2 gm  $\text{CaCl}_2$  had been added to the perfusate did not produce any such reaction in the course of  $\sim \frac{1}{2}$  hour. When 0.1 gm KCl plus 0.01 gm  $\text{CaCl}_2$  was introduced along with the perfusate, the reaction of the effectors was increased, but with a greater amount of

Title : Electrophysiological Investigations of the Phenomenon of Prohibitive Exhaustion of the Heart of a Frog by Means of Strophantine (Phenomenon Described by Daniyelopolu). Preliminary Report.

Orig Pub : Fiziol. norm. si patol., 1956, 3, No 2, 212-219.

Abstract : Daniyelopolu established that the isolated heart of a frog, stopped in a condition of contracture under the influence of massive doses of strophantine (I), can restore its performance in time under the action of massive doses of acetylcholine (II) or K. In the experiments of the authors, polarization by a direct-current cathode also caused restoration of the performance of the heart.

Card 1/2

Polarization by the anode strengthens the activity of I; restoration of contractions of the heart occurred in this case under the influence of II. If the heart stopped anew as a result of repeated dosage of II, then the renewal of its activity could be caused by anode polarization. According to the opinion of the authors, their experiments show the electrotonic nature of exhaustion of the heart and the cathelectrotonic properties of II and K.

2434. MODIFICATIONS OF INTEROCEPTIVE REFLEXES IN ALKALOSIS AND ACIDOSIS - Modificările reflexelor interoceptive în alcaloză și acidoză - Haulică L., Clejan L., Cîrstea M., Teodorini S. and GRIZAITIS E. - COM. ACAD. R. P. R. 1958, 8/12 (1335-1344) Graphs 4

Modifications induced by acidosis or alkalosis in splenic and intestinal interoceptive reflexes were studied in 29 dogs anaesthetized with urethan (1.6-1.7 g./kg. i.v.). The organ (spleen or intestinal loop) was perfused in situ with its nerve connections intact, an oxygenated Tyrode solution being used at 38°C. and under constant pressure and flow. Stimulation was effected by addition of KCl to the perfusion fluid. Reflex responses were registered before and after i.v. administration of Na bicarbonate or ammonium chloride, with recording, at various intervals, of the carotid pressure, respiration, ECG, enterogram, uterogram and kidney volume. Disturbance of acid-base equilibrium by excess of acid or base was verified in-

directly by determination of alkali reserve. In alkalosis there was an initial increase of interoceptive reflex activity followed by a decrease, according to the amount of bicarbonate administered. Acidosis always led to a decrease and sometimes a complete abolition of the respiratory and circulatory reflexes, and to an inversion or reinforcement, in the sense of excitation, of the viscerovisceral reflexes. The ECG and the kidney volume did not show reflex modifications. As the peripheral receptor apparatus was isolated from the vascular point of view, the phenomena are ascribed to modifications of sympathetic reactions due to the alkalosis or acidosis.

AUTHOR: Kotrbova, M.; Hauptman, Z.

TITLE: Growing crystals by the chemical transport method. III. Study of the growth of  $\alpha$ -iron crystals

SOURCE: Chekhoslovatskiy fizicheskiy zhurnal, v. 15, no. 1, 1965, 64-70

TOPIC TAGS: crystal growth, alpha iron crystal, crystal face, surface orientation, iron whisker, hydrochloric acid cycle, hydrobromic acid cycle, chemical transport method

ABSTRACT: The method of chemical transport is used for preparing crystals of  $\alpha$ -iron. The epitaxial growth of iron on iron seed crystals (whiskers) is studied during transport in closed quartz ampoules. The influence of a change in characteristic conditions, i.e., of the temperature of the growth zone, the difference in temperatures of the reaction and growth zones, the distance between the whiskers and the source, and the kind and concentration of the transport agent, on the quality of the surface of the grown layer is investigated. It was found that the method of chemical transport can be used to prepare larger crystals, bounded by smooth

TITLE: Optical and luminescence properties of neodymium-activated glass

SOURCE: Chukhoslovatskiy fizicheskii zhurnal, v. 14, no. 9, 1964, 698-706

TOPIC TAGS: activated barium glass, Neodymium, spectrum, absorption capability laser design, luminescence kinetics

ABSTRACT: The authors investigated the properties of barium glasses, activated with neodymium to determine their suitability for use in a laser. They measured the emission spectrum, the light absorption and the luminescence kinetics as temperature functions. From the parameters obtained the threshold of the stimulated emission was determined. The spectrum of  $Nd^{3+}$  ions in the glass was interpreted from that of a free  $Nd^{3+}$ . The effect of increasing the Nd content and other possible changes to improve the absorption capability are discussed. The laser design and the application of the investigated glass in the laser technique are also described. The author believes that the possibilities of improving the quality of the investigated glass are exhausted as far as the

Card 1/2

L 24325-65

ACCESSION NR: AP4046327

quantum yield is concerned. This is true regarding the homogeneity and the purity of the glass. However, there is a possibility regarding the width of the emission curve as well as in the Nd<sup>3+</sup> structure and luminescence center. Another possibility exists in the increase of the Nd content, thus augmenting the absorption coefficient.
